Step 2: Create Function App

Home

Create Function App

Select a hosting option

These options determine how your app scales, resources available per instance, and pricing. [Learn more about Functions hosting options](#)

Hosting plans	Flex Consumption	Functions Premium	App Service	Container Apps environment	Consumption (Windows)
Scale to zero	✓	-	-	✓	✓
Scale behavior	Fast event-driven	Event-driven	Metrics based	Event-driven with KEDA	Event-driven
Virtual networking	✓	✓	✓	✓	-
Dedicated compute and prevent cold start	Optional with Always Ready	Minimum of 1 instance required	Minimum of 1 instance required	Optional with minimum replicas	-

Create functions in your preferred environment

Create with Visual Studio

VS Code Desktop

Other editors or CLI

Best optimized for:

- Local development within Visual Studio
- Using a full .NET IDE

Best optimized for:

- Local development within VS Code
- Custom development tool requirements

Best optimized for:

- Using preferred editor for development
- Visual Studio, Intelli, command line

Create with Visual Studio

Create with VS Code Desktop

Set up your editor

Step 3: Create a Azure Function

```
12
13 public BlobUploadFunction(ILoggerFactory loggerFactory)
14 {
15     _logger = loggerFactory.CreateLogger<BlobUploadFunction>();
16 }
17
18 [Function("BlobUploadFunction")]
19 public async Task Run(
20     [BlobTrigger("uploads/{name}", Connection = "AzureWebJobsStorage")] Stream blob,
21     string name)
22 {
23     _logger.LogInformation($"Blob detected: {name}");
24     string logicAppUrl = "https://prod-21.centralus.logic.azure.com:443/workflows/f83aebc0f8a64d298cd5355add2f67fd/triggers/when_an_...";
25
26     try
27     {
28         var jsonPayload = $"{{ \"fileName\": \"{name}\" }}";
29         using var content = new StringContent(
30             jsonPayload,
31             Encoding.UTF8,
32             "application/json"
33         );
34
35         HttpResponseMessage response = await _httpClient.PostAsync(logicAppUrl, content);
36
37         if (response.IsSuccessStatusCode)
38         {
39             _logger.LogInformation("Logic App triggered successfully.");
40         }
41     }
42     else
43     {
44     }
45 }
```

Step 4: Paste the HTTP string:

Step 5: Publish the Project:

Step 6: Upload file in container in Storage

Step 7: Connection String

Step 8: Create a Event Grid Program on Visual Studio

Step 9: Create a Event Subscription

The screenshot shows the 'Create Event Subscription' page in the Microsoft Azure portal. The page is divided into several sections: 'Basics', 'Filters', 'Additional Features', and 'Delivery Properties'. The 'Basics' section is active and contains the following fields:

- EVENT SUBSCRIPTION DETAILS:**
 - Name: (empty text box)
 - Event Schema: (dropdown menu showing 'Event Grid Schema')
- TOPIC DETAILS:**
 - Topic Type: (dropdown menu showing 'Resource Group')
 - Source Resource: (dropdown menu showing 'rg_Demo')
 - System Topic Name: (empty text box)
- EVENT TYPES:**
 - Filter to Event Types: (dropdown menu showing '9 selected')

At the bottom of the page, there is a 'Create' button and a 'Give feedback' link.

Step 10: Publish the code

Step 11: We got the email
